

# Techniques for Explainable Artificial Intelligence in Insurance

EAA e-Conference on  
Data Science & Data Ethics

29 June 2021

*Dr. Oliver Pfaffel*  
*Munich Re*

## *WHAT WE WANT TO COVER TODAY:*

1. Risks from the use of AI
2. Techniques for explainable AI in insurance
3. Weak spots in explanation algorithms
4. Outlook on self-explaining AI

# INCURRED RISKS IN THE APPLICATION OF AI

"Success in creating AI would be the biggest event in human history. Unfortunately, it might also be the last, unless we learn how to avoid the risks."

--*Stephen Hawking*

## ***AI CAN FAIL IN CRITICAL APPLICATIONS***

### **2015: AI discriminating job applicants**

In their hiring process, Amazon used an AI algorithm that preferred male over female applicants.

### **2016: Chatbot AI out of control**

Microsoft deployed a chatbot on Twitter that “turned into a racist” within a few hours.

### **2018: Inaccurate AI-assisted medical diagnosis**

IBM Watson’s AI-based supercomputer helping doctors to diagnose patients is often inaccurate with respect to its oncology capabilities.

### **2019: Discrimination in the granting of loans**

Financial regulators in New York launched an investigation into the algorithm behind Apple’s credit card after users reported that women had received lower credit limits than men

## DISCRIMINATION IN PRICING FOR CERTAIN GROUPS OF PERSONS

### Example

#### **MO COMPARE Motorists fork out £1,000 more to insure their cars if their name is Mohammed**

Top firms such as Admiral and Marks & Spencers have been dragged into an insurance race row after giving far lower quotes for drivers with traditionally English names like John

Source: <https://www.thesun.co.uk/motors/5393978/insurance-race-row-john-mohammed/>

### Problem

- “The Sun” reported that motor insurers in UK had up to 69% higher prices for individuals called Mohammed instead of John (everything else being the same)
- The name was implicitly used by an AI algorithm to differentiate prices – discriminating against the ethnic origin

**Occam's razor** (the principle of parsimony) in times of trillion<sup>2</sup> parameter models:

	GLM/GAM	Decision Tree	Tree ensembles <sup>1</sup>	Deep Learning
Stat. robustness				
Functionality				
Predictive Perf.				
A priori Explainability				

- Tree ensembles often outperform GLM for classical actuarial problems
- For NLP and Computer Vision Deep Learning strongly outperforms classical approaches in most use cases
- Thus, we cannot always approximate a complex problem with a simple model
- Can we approximate the “reasoning” of a complex model by the “reasoning” of simple model or isolate certain “paths” of it?

→ Explainable AI

1. Random forest, tree boosting, etc. 2. Google's Switch Transformer has 1.6 trillion parameters

# TECHNIQUES FOR EXPLAINABLE AI IN INSURANCE

"An approximate answer to the right problem is worth a good deal more than an exact answer to an approximate problem."

-- *John Tukey*

# OVERVIEW<sup>1</sup> OF EXPLAINABLE AI (XAI)

Type of problem	Global Explanation <i>Which general principles determine a certain model behavior?</i>	Local Explanation <i>Which input can we attribute a certain model prediction to?</i>
Tabular data 	<ul style="list-style-type: none"> <li>• <b>Permutation Feature Importance:</b> <i>Aggregate impact of each feature on the prediction</i></li> <li>• <b>Partial Dependence / ALE:</b> <i>An increase in feature <math>x</math> changes a prediction by ...% on average</i></li> </ul>	<ul style="list-style-type: none"> <li>• <b>Ceteris paribus plots:</b> <i>Changing feature <math>x</math> changes the prediction by ...</i></li> <li>• <b>Breakdown plots / SHAP / LIME</b> <i>Contribution of each feature on a single prediction</i></li> </ul>

# GLOBAL AND LOCAL EXPLANATIONS FOR TABULAR DATA

**Use Case:** Prediction of loss severity in health insurance by age, gender, physical status and further risk factors

Global explanation using a  
Partial Dependence Plot

Overall impact of physical status

Local explanation using a break down plot  
(here: xgboostExplainer)

Loss prediction for a single insured

# OVERVIEW<sup>1</sup> OF EXPLAINABLE AI (XAI)

Type of problem	Global Explanation <i>Which general principles determine a certain model behavior?</i>	Local Explanation <i>Which input can we attribute a certain model prediction to?</i>

# FEATURE ATTRIBUTION IN NATURAL LANGUAGE PROCESSING

**Use Case:** Predict the likelihood of a default of a certain company within a certain time frame

Local Interpretable Model-agnostic Explanations (LIME) uses linear models to replicate the prediction of the more complex original model

Prediction probabilities

Decision Threshold

Prediction of “default” since score is above the threshold (note that there is a low incidence rate of observed defaults)

Orange words guide the prediction towards “default”

non-default

default

“ (..) avoid the (..) dismissal of the 114 workers (trabajadores)”

“likely entry into bankruptcy (concurso de acreedores)”

## Text with highlighted words

Coopbox Hispania S.L.u El portavoz del PSOE en el Ayuntamiento de Lorca, Diego José Mateos ha mostrado su apoyo a los trabajadores de Coopbox Hispania Lorca y se pone a disposición de los mismos, tras la más que probable entrada en concurso de acreedores de esta empresa de envases, ubicada en el polígono Saprelorca. Mateos ha pedido la implicación directa del gobierno local y autonómico para evitar el cierre de Coopbox Lorca y con ello, el despido de los 114 trabajadores. El portavoz socialista ha trasladado a los trabajadores su apoyo y solidaridad y se ha puesto a su disposición para ayudar en lo que haga falta y esté en nuestras manos. Mateos ha puesto de.

# WEAK SPOTS IN EXPLANATION ALGORITHMS

“Post-hoc XAI models are also just models.”

## *XAI RELIES ON ASSUMPTIONS AND IS PRONE TO ATTACKS*

- XAI techniques typically make use of the underlying training / testing data
- Often data perturbation is required for ceteris paribus explanations (= “what if”) or contrastive explanations
- XAI is often sensitive towards changes of the input data
- XAI may rely on the method for data perturbation (if applicable)

## LIME & SHAP RELY ON THE METHOD FOR DATA PERTURBATION

- A malicious attacker may **hide a biased model** under the hood of a seemingly unbiased model from an auditor
- Works for (Kernel) SHAP or LIME since the data perturbation mechanism is known

Black: Data point

Blue: Artificial data point close to data

White: Artificial data point out of data (OOD)

### Explanation of the attack

1. Points close to the data are labelled "data", rest "OOD"
2. Train a classifier
3. Define adversarial model such that a biased model is evaluated on what is predicted „data“, and an unbiased model on all other data points

Source: Slack, D., Hilgard, S., Jia, E., Singh, S., & Lakkaraju, H. (2020, February). Fooling lime and shap: Adversarial attacks on post hoc explanation methods. In *Proceedings of the AAAI/ACM Conference on AI, Ethics, and Society* (pp. 180-186).

- Individual credit assessment based on account information
- Biased classifier uses only gender to make a decision (unfair)
- Unbiased classifier uses only "Loan Rate relative to Income" (fair)
- Explanation of adversarial model with LIME and SHAP seems to confirm that "gender" is of minor importance

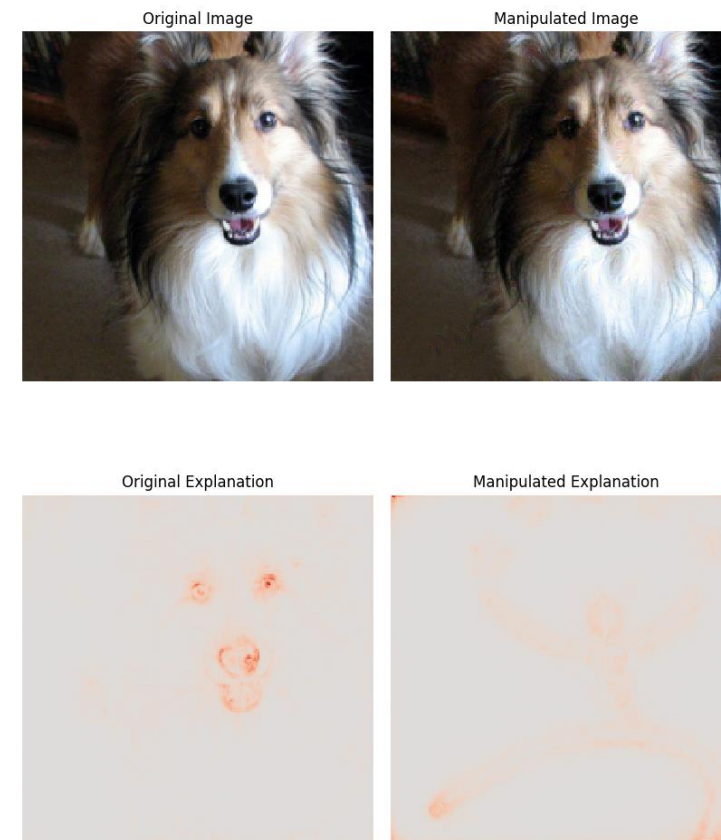

## INTEGRATED GRADIENTS IS SENSITIVE TOWARDS THE INPUT DATA

- Idea: Fine-tuning of the model adding a target explanation to the loss function:

$\text{Loss} \sim \text{distance}(\text{manipulated explanation, target explanation}) + \gamma * \text{distance}(\text{manipulated prediction, original prediction})$

- The updated model provides visually the exact same prediction (though there is a slight numerical change)
- The explanation is very close to the target, which can be virtually anything
- Why relevant?
  - Shows the limitations of post-hoc XAI
  - Can be exploited if the attacker can select or has knowledge of the data used to explain the model
  - Situation where the task is difficult even for a human and the explanation is required to understand the prediction (e.g. medical AI)

Source: Dombrowski, A. K., Alber, M., Anders, C. J., Ackermann, M., Müller, K. R., & Kessel, P. (2019). Explanations can be manipulated and geometry is to blame. *arXiv preprint arXiv:1906.07983*.

# SELF- EXPLAINING AI

“Making Explainability part of AI.”

## *XAI CAN BE MADE PART OF THE MODEL'S PREDICTION*

- Loose definition of self-explainable AI: Explainability is part of the modelling process

- Very active research field
- Current approaches mostly fall into one of these categories:
  - Explainable model architecture: interpretation layers<sup>1</sup>, hierarchical target structure<sup>2</sup>
  - Explanations as part of Model training:
    - Explanation part of annotated data
    - Multi-modal modelling where the different predictions are used to complement each other's plausibility

1. Sun, Z., Fan, C., Han, Q., Sun, X., Meng, Y., Wu, F., & Li, J. (2020). Self-Explaining Structures Improve NLP Models. arXiv preprint arXiv:2012.01786. 2. Hase, P., Chen, C., Li, O., & Rudin, C. (2019, October). Interpretable image recognition with hierarchical prototypes. In *Proceedings of the AAAI Conference on Human Computation and Crowdsourcing* (Vol. 7, No. 1, pp. 32-40).

# XAI AS PART OF THE TRAINING PROCESS

**Use Case:** predict the degree of damage of a roof after a natural catastrophe

- The applied convolutional neural net is complex and has 35 mio. Parameters
- However, the problem formulation makes its output well interpretable by design
- Annotated images covering one or more classes with 200-800 images per class (excluding reference classes "background" or "no damage")
- Target categories like "tarps on roof" and "tree on roof" provide an explanation why there is no damage assessment

Local explanation of the model's prediction using self-explaining AI architecture

**Color Legend**

- Healthy roof
- Light layer damage
- Deep layer damage
- Roof collapsed
- Tarps on roof
- Tree on roof

## TEXTUAL AND VISUAL EXPLANATIONS COMPLEMENT EACH OTHER

- Examples: visual question answering (QA) and activity recognition
- For each task ~ 50k explanations were made → high effort for annotation
- Only ~<50% of explanations as good as human explanations (human evaluation)

Prediction (=A)  
enhanced by  
textual  
justification and  
visual highlighting

Q: Is this a zoo?

A: No

... because the zebras are standing in a green field.

A: Yes

... because there are animals in an enclosure.

The activity is

A: Mountain Biking

... because he is riding a bicycle down a mountain path in a mountainous area.

A: Road Biking

... because he is wearing a cycling uniform and riding a bicycle down the road.

Annotated explanations for images: visual highlighting (left) and textual QA explanation (right), not only a description

Q: What is the person doing?

A: Skiing

Q: What is the boy doing?

A: Skateboarding

<VQA-X>

Description

A gang of biker police riding their bikes in formation down a street.

Explanation

Q: Can these people arrest someone?  
A: Yes.  
Because... they are Vancouver police.

<ACT-X>

A man standing wearing a pink shirt and grey pants near a ball.

I can tell the person is juggling.  
Because... he has two balls in his hands while two are in the air.

- With Munich Re for the past 8 years
- Currently specializing in Natural Language Processing for automatic underwriting & pricing as well as concepts for a responsible application of AI in insurance
- Prior: used machine learning techniques for biometric analysis & best estimate derivation as an actuarial data scientist in life insurance
- PhD in mathematical statistics from the Technical University of Munich
- Lectured a course on life insurance mathematics at TUM
- Developer and maintainer of two Clustering R packages
